

NEW APPLICATIONS OF SUPERIOR TECHNOLOGY

ENTOLETER CENTRIFUGAL MIXERS

Entoleter's centrifugal mixer, or CentriMix[®], provides a uniform, homogenous mix while reducing processing time, costs, and improving the quality of the finished product.

The CentriMix provides greater capacity at higher efficiency with free flowing, dry or slurry mixtures. Equally adaptable to continuous or batch operation, the CentriMix assures full homogenization with thorough and consistent blending and complete dispersion of trace ingredients. Further, the CentriMix has the ability to break up and eliminate small nodules and agglomerates which may form during the mixing process.

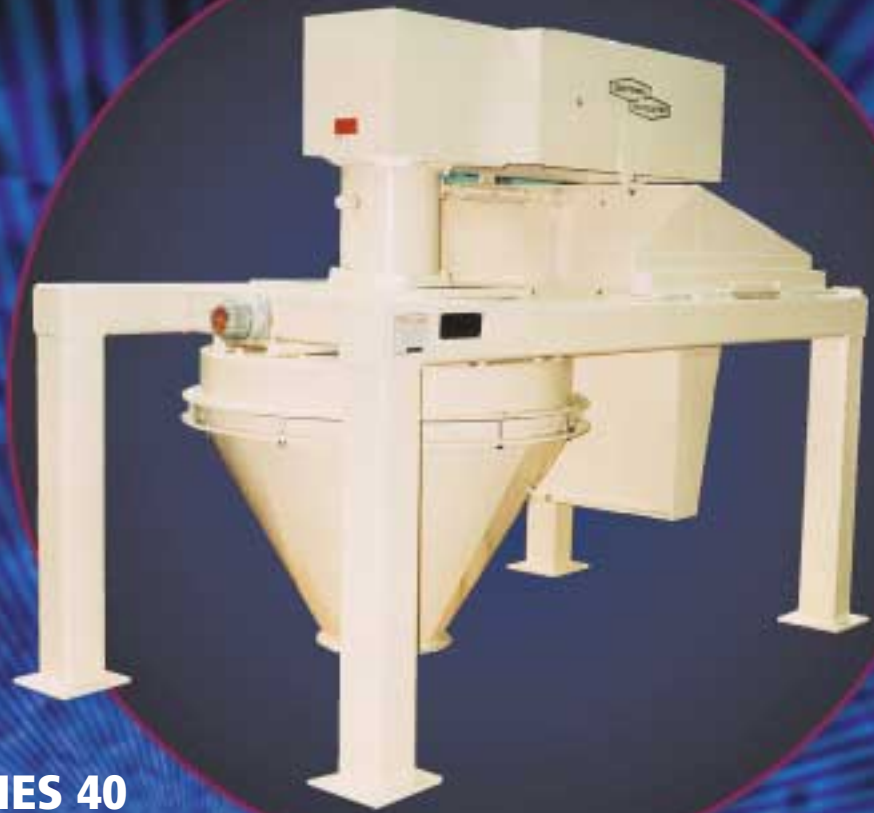

The unique capabilities of the CentriMix are a result of its ability to apply high energy directly to the product making possible finer, more uniform blends which are not otherwise attainable at comparable costs.

The high intensity impact is very effective for coating applications. Impact action can be adjusted to provide increased surface area of the particle while simultaneously applying the coating.

The Entoleter CentriMix is easy to install in an existing system, requires a minimum of floor space (it can be ceiling mounted), and is entirely self contained. All models of the Entoleter CentriMix can be adapted for open processing or dust-free closed systems.

**SERIES 40
Direct Drive**

**SERIES 40
Belt Drive**

ADVANTAGES OF THE CENTRIMIX

- Greater efficiency & lower cost
- Nearly all horsepower input is transferred directly to the product
- Better uniformity & quality
- High capacity & compact size
- Ease of cleaning & maintenance

The CentriMix produces finished mixtures at rates from one ton to more than fifty tons per hour. The Entoleter CentriMix can be used to supplement ribbon type blenders by shortening premix time in batch operations. With the use of accurate metering devices, instantaneous mixing and blending occurs.
